

Bridge Owners Forum Presentation Cameron Archer-Jones and Arfon Irish

### Ageing bridge stock

Our aging bridges will increasingly not meet the requirements of modern codes.

### Costly Strengthening Or Decommission and Replace

### Vision

Bridge Loading – X% at XX:YY:ZZ

### **Carbon Saving**

## **Traffic Loading by the codes**

Single vehicle or knife edge load

Loaded length with mix of vehicles

## Digital BSALL Codified method

- · Codes are conservative. They have to be!
- They assume the worst traffic mix.
- But most bridges are not just outside a timber mill and an amazon depot.

Assumed traffic mix

Our bridge

## Digital BSALL Real Traffic

- Real Traffic is a mixture of heavies and mostly light cars.
- Only barrier to using this is proving it!

Assumed traffic mix

Our bridge

## **BSALL Process**

- Measure traffic loads over ~3 months.
- Calculate custom assessment traffic loads (BSALL).
- Assess bridge.
- Repeat every 2 years.

### **Benefits of a BSALL**

### How to collect weights

We can measure traffic mix with a **Weigh in Motion Systems**.

### Pros:

Full information on weight of every axle.

### Cons:

- Expensive to procure.
- Requires repeated calibration.
- Cannot resurface without disturbing.

## The proposal

Use video feeds to identify vehicle types.

#### Pros:

- Only needs a video feed.
- Easily maintainable and cheap.
- No expensive calibration.

#### Cons:

• No weight data, only vehicle category.

### Missing weight data

 Vehicle weight differences between locations

## Next steps & discussion

- WIM vehicle data and video footage for a set of assets from existing data or from a trial – interest in collaborating?
- Indication of asset portfolio?
  - Mix of spans within your portfolios? Exp. gain from  $\ge$  40 m
- Would you or your organisation find this of use?
- Where would you suggest we take this next?

# Digital BSALL Missing weight data

Comparison between weight distribution in WiM system data and simulated data

## Traffic weight through day

Our method does not currently allow for variation in vehicle weight by time of day.

This could easily be developed for further accuracy.

## **Daily traffic data**

### Not appropriate for a BSALL

### **Extrapolation process**

Extrapolate to ULS traffic jam. Still conservative and therefore safe!
